

Rail4Future

Projekttitel:	Resilient Digital Railway Systems to enhance performance
Projektnummer:	882504
Deliverable:	Deliverable 1.1.6 Simulation Deployment Results

In this deliverable, we present and analyze simulation results derived from use case deployments within the R4F Platform. These results consist of validation curves (FMI-based vs. raw model simulation), CSV- and JSON-datasets, which are valuable for visualization, analysis and exchange among all stakeholders. This result acquisition has an important part in quality assurance of the use case implementation in the platform (see Deliverable D1.1.5 & D1.3.5). This process enables us to confirm the proper functionality of the integration, delivery, and deployment of assets associated with various railway use cases.
